

Put it to Work: Prepare for Cybersecurity Jobs

Module 1

Security mindset: The ability to evaluate risk and constantly seek out and identify the potential or actual breach of a system, application, or data.

When a security event results in a data breach, it is categorized as a security incident

Module 2

Incident escalation: The process of identifying a potential security incident, triaging it, and handing it off to a more experienced team member.

Essential skills to escalate

- Attention to detail

- Ability to follow an orgs escalation guidelines or processes.

Malware infection: An incident type that occurs when malicious software designed to disrupt a system infiltrates an orgs computers or network

Unauthorized access: An incident type that occurs when an individual gains digital or physical access to a system or application without permission.

Improper usage: An incident type that occurs when an employee of an org violates the organizations acceptable use policies.

Escalation policy: A set of actions that outline who should be notified when an incident alert occurs and how that incident should be handled.

Module 3

Risk manager responsibilities

Identify risks

Manage the response to security incidents

Notify the legal department

Inform the orgs public relations team

Security story details

What the security challenge is

How it impacts the org

Possible solutions to the issues

Module 4

Cyber security community

Module 5

Prompt: The input you provide to the AI model to elicit a specific response.

A good prompt follows a simple frame: Thoughtfully Creating Really Excellent Inputs

Task: What do you want it to do

Persona: What expertise you the GEN AI tool to draw from.

Format: How you want the output to appear

Context: Necessary details to help the GEN AI tool understand what you need from it.

References:

Evaluate: If the input you provided gave you the output that you needed.

Iterate: If output is not what you needed you can give it more information.

Use Human in the loop approach
